FOOD DELIVERY · EGYPT

BYTE_ME

FOOD, ONE BYTE AWAY.

Pick a restaurant, fill your cart and order in a few taps. Then follow your order from pending to completed.

01 · THE PROBLEM المشكلة

Ordering food by phone is slow and confusing.

Busy phone lines

At lunch time the restaurant's phone is busy, and you have to keep calling.

No menu in front of you

You can't see the dishes, their photos or their prices, so you guess what to order.

No idea where your order is

After you hang up, you don't know if your food is being made or forgotten.

WHO IT'S FOR لمن هذا التطبيق

Four kinds of people, one app.

01

Guests

Look at restaurants and menus before making an account.

02

Customers

Fill a cart, pay with cash, card or wallet, and follow their orders.

03

Restaurant owners

Add their dishes with photos, prices and stock.

04

Admins

Add restaurants and move every order from pending to completed.

OUR SOLUTION الحل

Choose. Fill. Order.

1

Choose

A restaurant. Search by name or pick a food type.

→

2

Fill

Your cart from one menu. ➖ / ➕ stop at what is in stock.

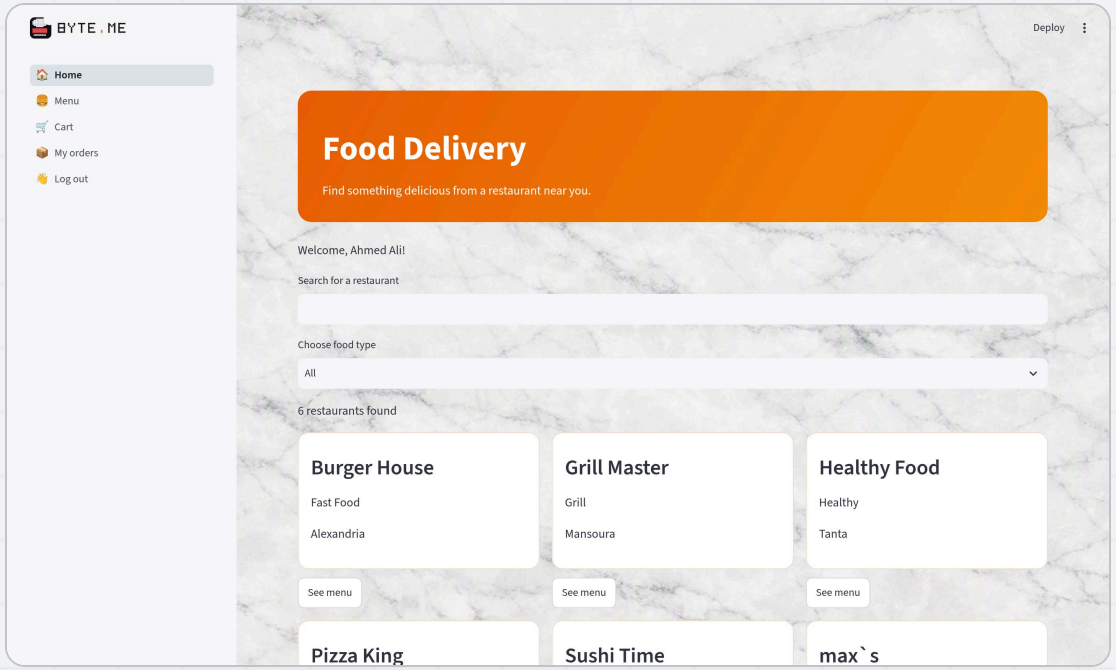

→

3

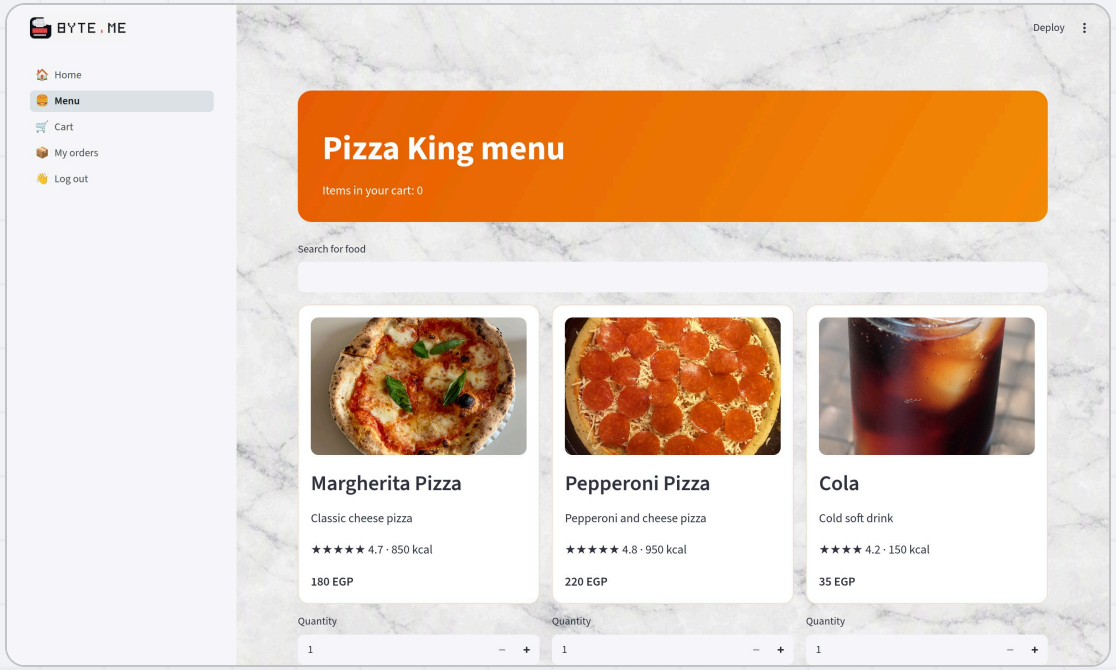

Order

Address, notes, and cash, card or wallet. Then follow it on “My orders”.

Find something to eat.

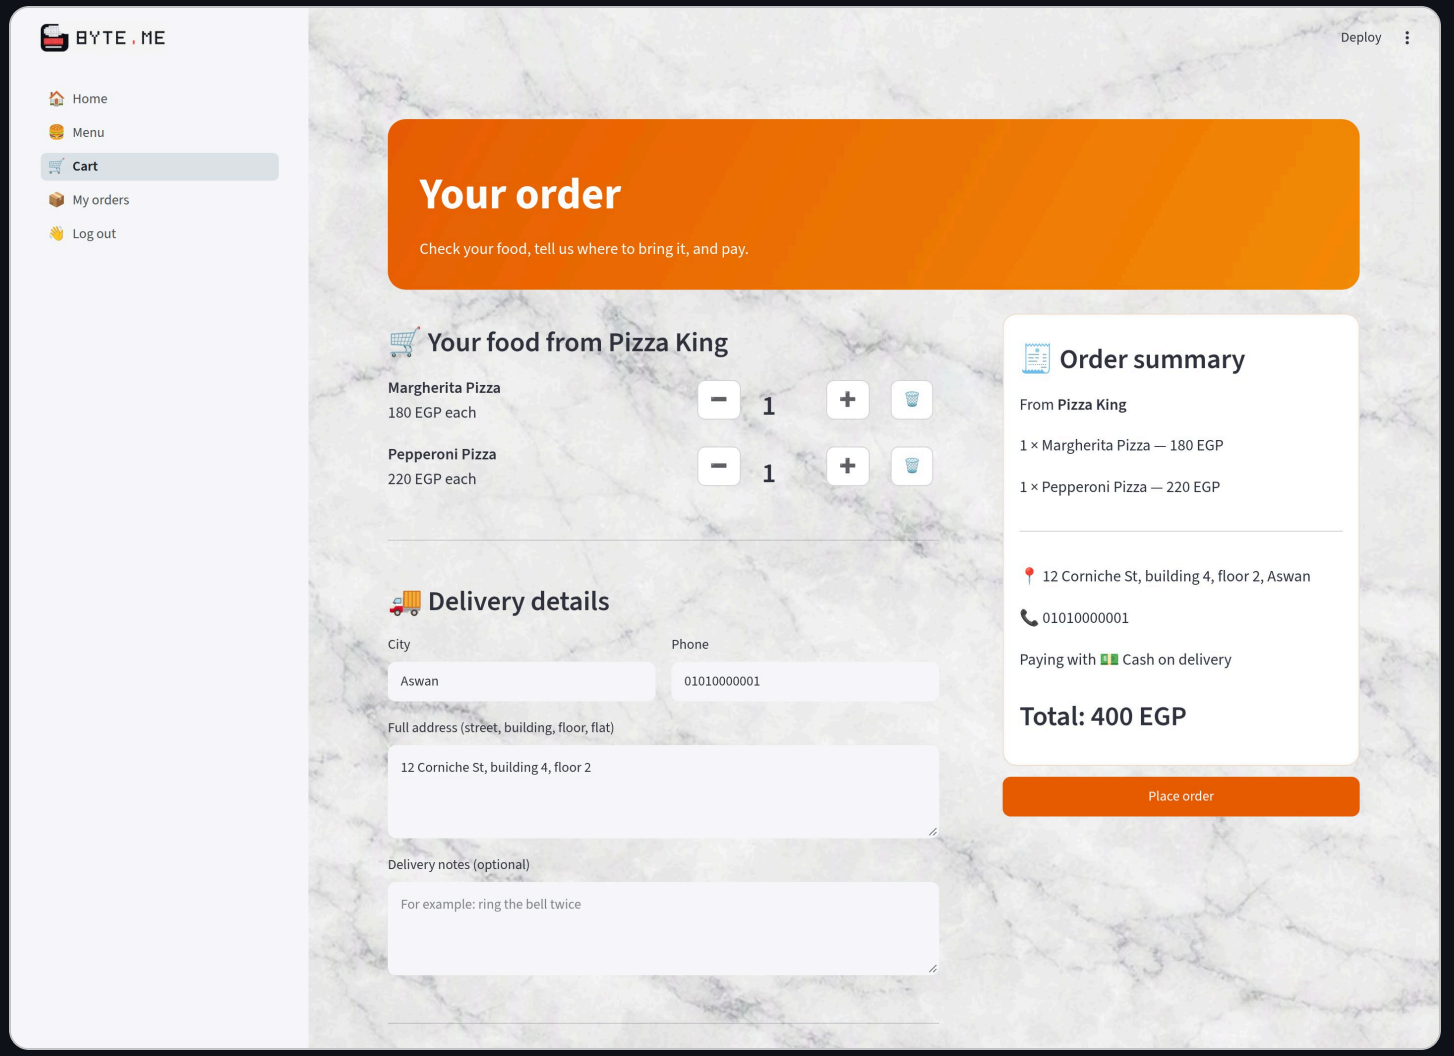

Home: every restaurant, with search and a food-type filter.

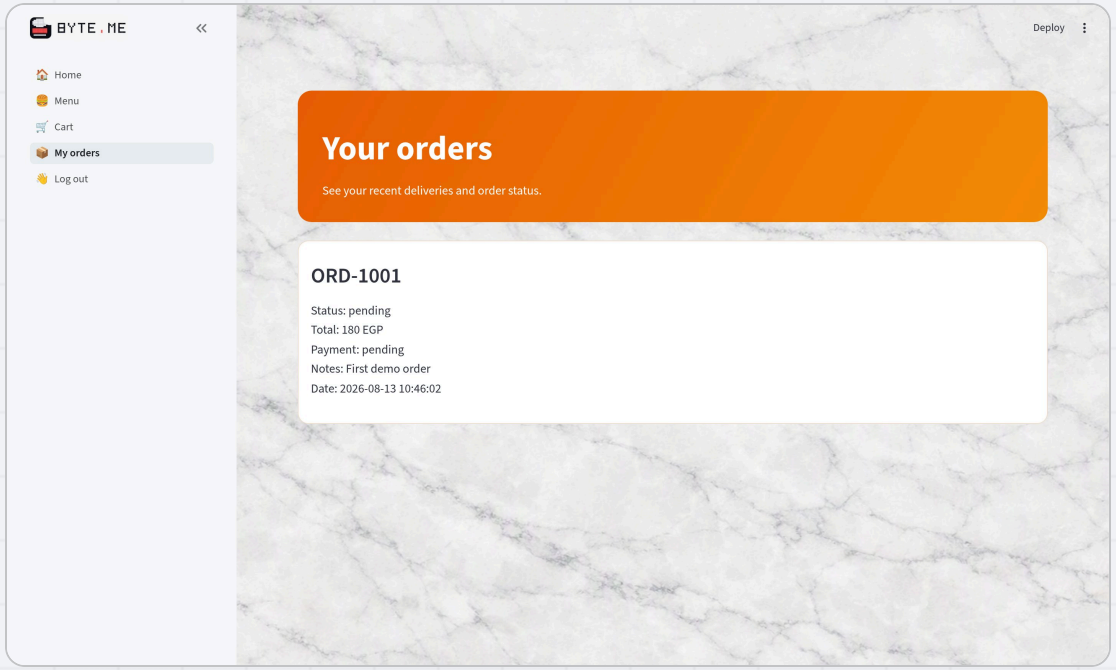

Menu: each dish with its photo, rating, calories and price.

Check out on one page.

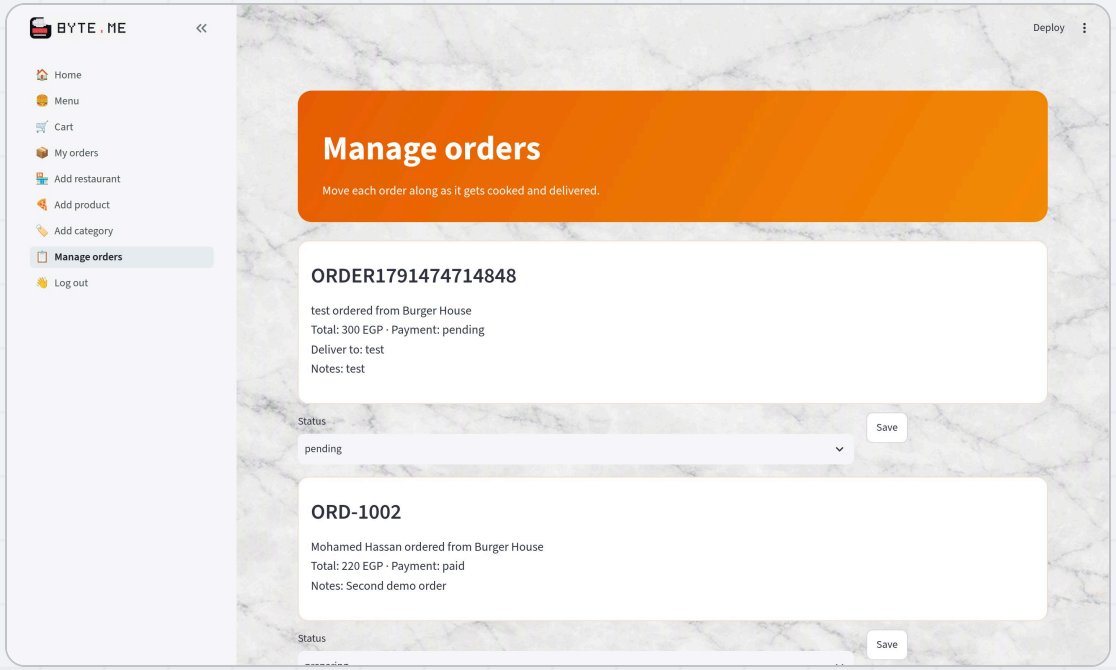

- **Change amounts**
  ➖ / ➕ for each dish, never above the stock.
- **Say where to bring it**
  City, full address, phone and delivery notes.
- **Pick how to pay**
  Cash on delivery, card, or mobile wallet.
- **See the total**
  The summary adds it all up before you order.

Follow the order.

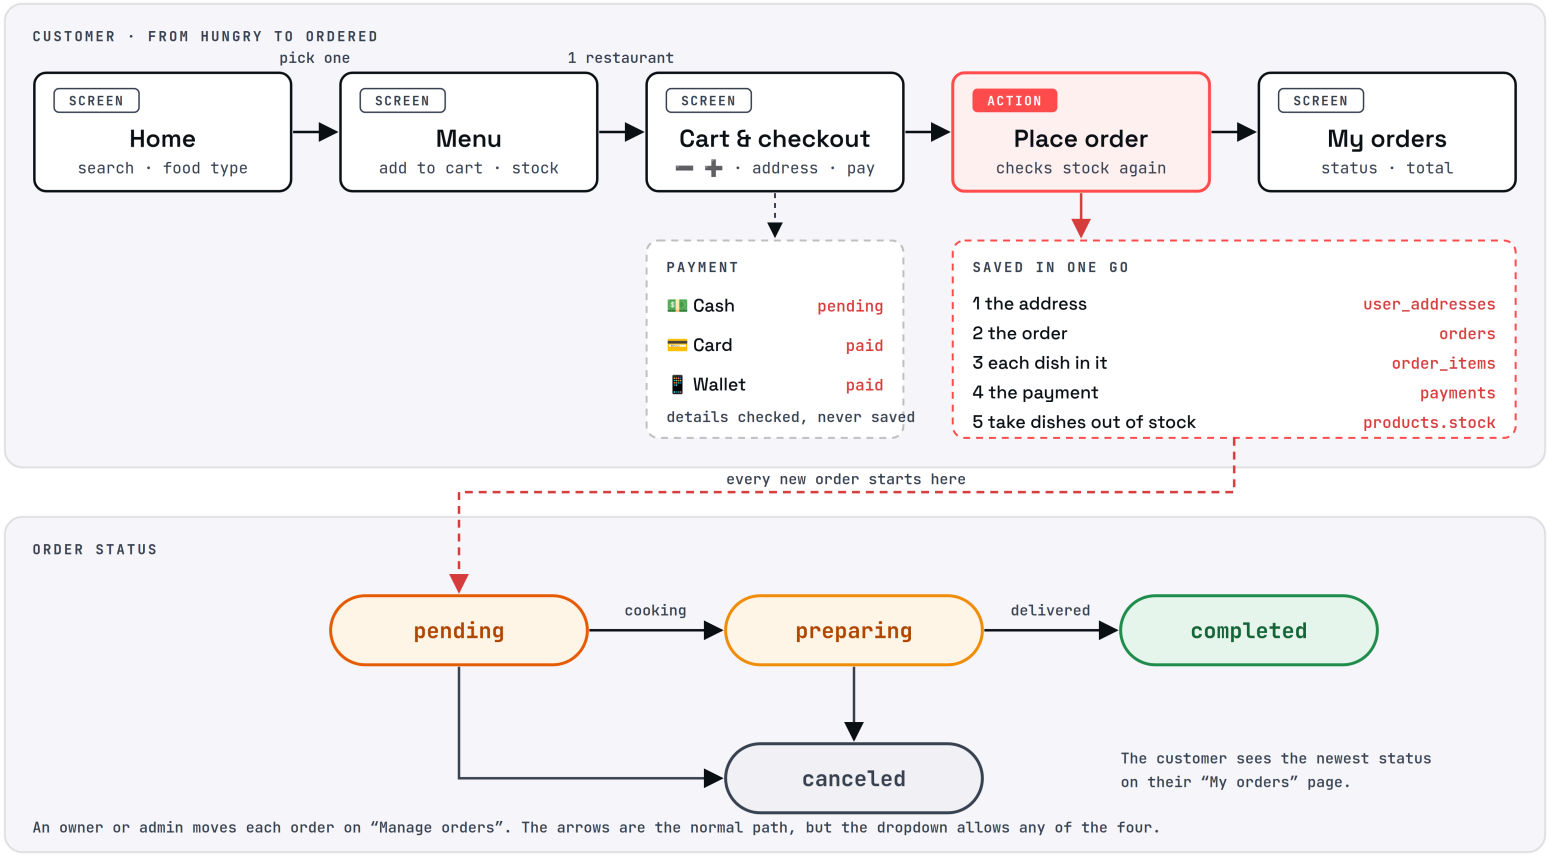

My orders: the customer sees the status, total and notes.

Manage orders: an owner or admin moves it from pending to completed.

One click, five saves.

5 rows saved when you press "Place order"

2 stock checks: in the cart, and again at checkout

4 order steps: pending, preparing, completed, canceled

Built so a beginner can read every line.

HOW THE MENU IS BUILT

EVERY RERUN

app.py runs first

Before any screen, every single time.

SESSION

Who is logged in?

st.session_state.user
None, or {"id", "name", "role"}

ST.NAVIGATION

Only allowed pages go in

A page that is not in the list cannot be opened at all.

> Hide what you can't use, instead of showing it and saying no. So the screens never check permissions themselves.

1 library to install: Streamlit

0 classes: plain variables, ifs and loops

12 Python files, one per screen

8 SQLite tables, from users to payments

Python + Streamlit for the website · SQLite for restaurants, dishes, orders and payments · plain SQL in each screen.

WHY THE NAME سر الاسم

BYTE.ME

“Byte” is a small piece of computer memory, and it sounds just like “bite”. The logo is a pixel-art lunch box with a bite taken out of its corner, drawn like an old computer picture. So the name mixes the two things the app is made of: food and code.

Thank you.
